homeotic protein Hox D8 - mouse
homeotic protein Hox 4.3

N/Alternate names: homeotic protein Hox 4.3

C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Accession: A4356
A;Title: Primary structure and embryonic expression pattern of the mouse Hox-4.3 homeobod A;Title: Primary structure and embryonic expression pattern of the mouse Hox-4.3 homeobod A;Reference number: A43562; MuID:91209232; PMID:1982431

-!-FUNCTION: Pair-rule protein that determines both the size and during embryogenesis. DNA-binding transcription factor that acts during embryogenesis. DNA-binding transcription factor that acts primarily as a transcriptional repressor but can also function as a transcriptional activator, depending on the stage of development and spatial restrictions (By similarity). May function redundantly with odd and drm in leg joint formation during the larval stages, acting downstream of Nocch activation.

-!- SUBCELLULAR LOCATION: Nucleus (Probable).

-!- TISSUE SPECIFICITY: Has two temporally distinct modes of expression during early embryogenesis; expressed in a non-periodic domain at the blastcoderm stage. Also expressed in a non-periodic domain at the anterior of the embryo. During gastrulation, the seven primary stripes that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  STRAIN=Berkeley; TISSUE=Embryo;

               each of the 14 segments in the extended germ band. Expression is relatively weak at the blastoderm stage, gaining in intensity at gastrulation. Expressed in the invaginating stomedeum and proctcodeum of the embryonic gut. By stage 13, expressed in the region that will form the proventriculus and in a wide ring at the most posterior portion of the midgut. Expression continues in the gut through the remainder of embryogenesis. Expressed in the proximal Malphighian tubules, brain and pharyngeal muscles during late embryogenesis. Expressed weakly in a segmentally repeated pattern in the leg disk at the distal edge of each presumptive leg segment except in tarsal segments 1 to 4.

SIMILARITY: Contains 5 C2H2-type zinc fingers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Metal-binding; Nuclear procein; Pair-rule protein; Repeat; Repressor;

The present invention describes compositions (I) comprising a peptide with an amino acid sequence with tyrosine (Y), lysine (K), and/or valine residues. The complex of the peptide with a major histocompatibility complex (MHC) class II HLA-DR2 protein is involved in modulating an immune response. (I) has antiinflammatory and neuroprotective activities, and can be used as a MHC class II protein inhibitor. The compositions such as multiple sclerosis, post-viral encephalomyelitis, a post-vaccine demyelinating condition, and a side effect of administering an anti-tumour necrosis factor agents. The peptide further inhibits proliferation of autoantigen-specific HLA-DR2-restricted T cell clones. ABP52207 to hard.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New compositions comprising synthetic peptides in complex with a major histocompatibility complex class II HLADR2 protein, useful for treating a demyelinating disease, e.g. multiple sclerosis, or post-viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human leukocyte antigen, HLA, major histocompatibility complex; MHC; HLA-DR2; MHC class II DR-2 molecule; demyelinating; multiple sclerosis; immune response; antiinflammatory; neuroprotective; proliferation; MHC class II protein inhibitor; demyelinating disease; inhibition; post-viral encephalomyelitis; post-vaccine demyelinating condition;

                                                                                                       ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an isolated MHC class II compound (I) comprising: (a) an MHC class II component comprising at least a portion of an MHC class II alpha chain and at least a portion of an MHC class II beta beta chain, such that the MHC class II alpha chain and MHC class II beta chain form a peptide binding groove; (b) a spaceholder Molecule; and (c) an effector component, where the effector component is linked to the MHC class II component. Also described: (I) a pharmaceutical composition comprising the MHC class II molecule and a carrier; (2) a method of producing an MHC class II compound; (3) a method of directly identifying an antigen-specific T cell; (4) a method of regulating an immune response in a subject; (5) a method of treating an immune disorder in a subject; (7) a method of treating an immune disorder in a subject; (1) has virucide, antibacterial, antiparasitic, cytostatic and immunosuppressive activities, and can be used in gene therapy. The MHC class II compound (I) can be used for preparing a composition for treating immune cativities, and can be used in gene therapy. The MHC class II compound confections, neoplastic disease, autoimmunity or toxicity. The present sequence represents a spaceholder molecule peptide, which can be used in the present invention.
